1. Overview

This report summarizes the results of monthly control measurements of IPCA2 performed over the period of April 2019 through March 2020 and represents an annual performance overview for JFY19. Monthly measurements of Plutonium neutron detection efficiency, AmLi stability, Curium stability and HPGe gamma spectra of Plutonium standards were performed and analyzed, when nuclear materials were available. Note that there were a few periods when nuclear material use was restricted during the reporting period that affected some monthly measurements and they are reported in this document. All the results are shown with respect to the updated control bounds established based on JFY18 data. Current data (for JFY19) will be used to establish new control bounds for JFY20 and these new control bounds are summarized in Appendix A. This report also documents rotation of IPCA2 performed during JSGO/NMCC/JAEA visit in July 2019 as well as long-term horizontal test to evaluate effects of prolonged horizontal configuration on IPCA2 performance for shipping considerations. Based on Pu efficiency measurements, the performance of the IPCA2 during this reporting period was stable within 0.7% at 1 σ level, which includes the performance before and after both IPCA2 rotations. Measurements were compared to room temperature and humidity and no dependence was observed. During September 2019 IPCA2 MIC was upgraded to MIC3 to fully support JSR15 and DSPEC50 capability and current report therefore represents the first MIC3 test in unattended mode for JSR15.

2. Plutonium Efficiency

2.1. Efficiency Monitoring

Plutonium efficiency measurements were performed between April 2019 and March 2020. The LANL Plutonium standard, FZC157 (823.6 neutrons s⁻¹ emission rate), was used in all measurements. This source was placed in the IPCA2 for a duration of 1800 s during which 60 cycles of 30 s were used to calculate a Singles rate (in counts per second, cps). The Singles rate was divided by source activity to determine an efficiency as shown in Figure 1. Average efficiency corresponding to the JFY19 control period was calculated and corresponds to 7.30 ± 0.05 . All measurements were within the control chart 2σ bands, denoted with dotted lines in Figure 1. Note that there were several instances between April 2019 and March 2020 with restrictions on use of Plutonium-bearing materials. These windows correspond to periods of July-August, November-January and March 2020. Therefore, only limited number of control measurements using the Plutonium standard could be performed. The other sources (AmLi and Cm) were not affected by these restrictions and regular monthly measurements were performed as reported in Section 3 of this document. These measurements along with the performed Pu-efficiency measurements provide a good overview of the overall IPCA2 performance during the JFY19 reporting period and confirm its stability and reproducibility. In addition to these regular measurements, series of surrogate efficiency measurements was performed during July-August and November-January timeframe using ²⁵²Cf source. These results are reported in Section 8 and were performed to establish IPCA2 performance before and after rotations. Also these measurements confirm IPCA2 stable performance.

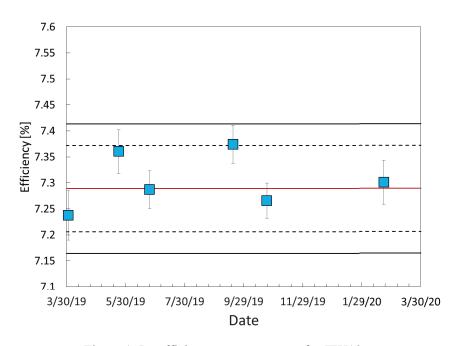

Figure 1: Pu efficiency measurements for JFY19.

Updated control bounds will be established based on the data shown in Figure 1 for use in JFY20 measurements. The updated control bounds are provided for reference in Appendix A. All the Pu efficiency measurements since May 2013 are summarized in Figure 2. Note that these measurements are plotted against the original control bounds established from 2013-2017 data in [1].

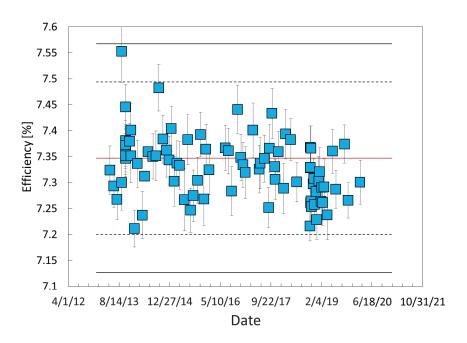

Figure 2: Pu efficiency measurements for May 2013 – March 2020.

2.1. Efficiency Dependence on Environmental Conditions

Room temperature and humidity data has been collected alongside IPCA2 measurements. JFY19 Plutonium efficiency measurements exhibit no dependence on humidity, Figure 3, or room temperature, Figure 4. Updated control bounds established from this JFY19 data and reported in Appendix A will be used for JFY20 control charts.

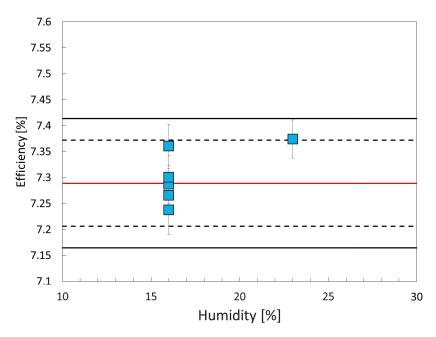

Figure 3: JFY19 Pu efficiency measurements as a function of humidity.

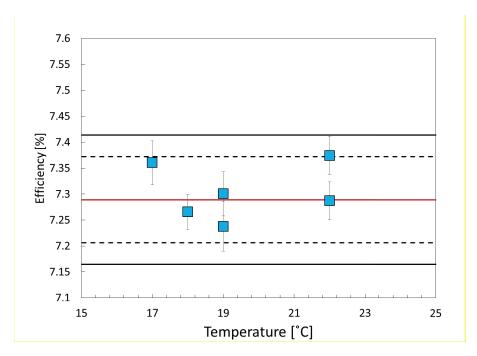

Figure 4: JFY19 Pu efficiency measurements as a function of room temperature.

3. AmLi Stability

3.1. AmLi Stability Measurements

AmLi stability measurements performed between April 2019 and March 2020 are summarized in Figure 5, with an average (decay corrected) count rate of 244504 ± 56 . Overview of all decay corrected AmLi stability data from May 2013 is shown in Figure 6 against the original control bounds established in [1]. Note that the decay correction on the AmLi data is with respect to 01/12/2017, when the original control bounds were established. Most results were within the 3σ control lines, however a few results near or outside 3σ were observed. As discussed in previous reports [e.g. 2], it is believed that source positioning and redistribution of contents of AmLi sources resulted in the observed variation of count rates. To mitigate this issue, we began to perform a Curium stability measurement in October 2018, to assess its feasibility as an alternative to AmLi; those measurements are described in the next section. No dependence of AmLi count rate on humidity or room temperature was observed, as shown in Figure 7 and Figure 8, respectively. New control bounds were established based on all JFY19 data for use in JFY20 control measurements and are reported in Appendix A.

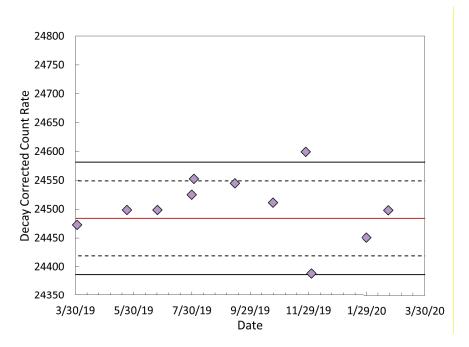

Figure 5: AmLi stability measurements for JFY19. Note that error bars are smaller than the size of symbols.

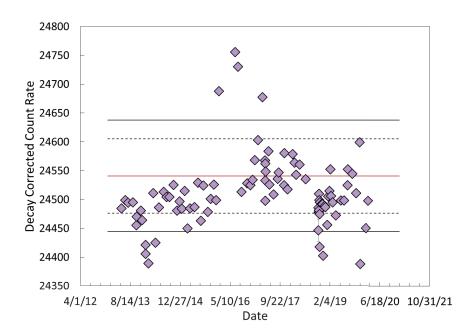

Figure 6: AmLi stability measurements from May 2013 – March 2020.

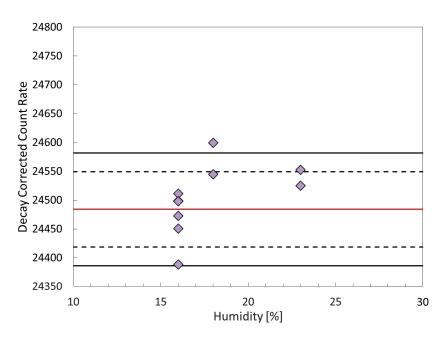

Figure 7: JFY19 AmLi stability measurements as a function of humidity.

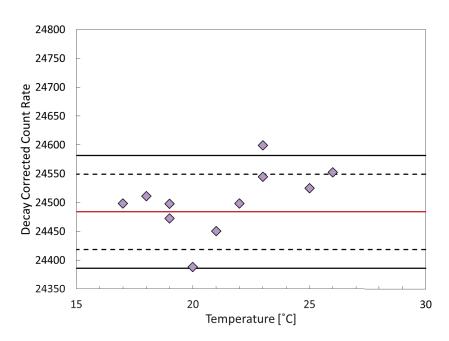

Figure 8: JFY19 AmLi stability measurements as a function of temperature.

4. Curium Stability

In October 2018 LANL started to perform monthly measurements with a Curium source to evaluate its feasibility as a potential replacement for the AmLi stability measurements. The decay corrected (with respect to the first measurement on 10/15/2018) results of the Curium measurements performed over the JFY19 reporting period are summarized in Figure 9 and correspond to an average count rate of 986.7 ± 1.2 . Results reported here were used to establish new control bounds for JFY20 provided in Appendix A. Note that the decay correction was updated in JFY19 to fully reflect the isotopic composition of the Curium source based on the source certificate and takes into account contributions from 246 Cm as well as 240 Pu. The average count rate for JFY18, reported in [2] changed to 986.2 ± 1.6 using this updated decay correction.

Overview of all decay corrected Cm stability data from October 2018 is shown in Figure 10 against the original control bounds established in [1]. Curium stability was also evaluated as a function of humidity and temperature as shown in Figure 11 and Figure 12, respectively. No dependence on humidity and room temperature has been observed over the reporting period.

Based on the trends observed so far, Curium appears to be a viable alternative to AmLi sources.

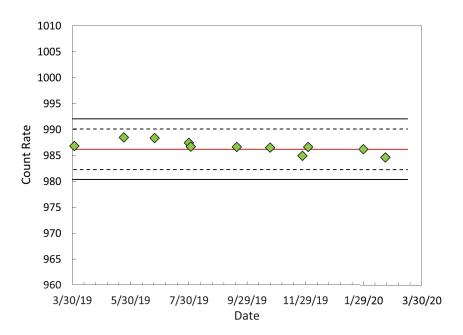

Figure 9: Curium count rates since for JFY19. Note that error bars are smaller than the size of symbols.

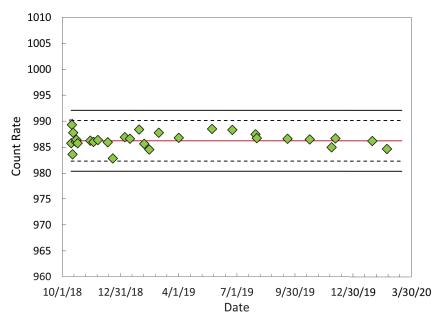

Figure 10: Curium stability measurements from October 2018 - March 2020.

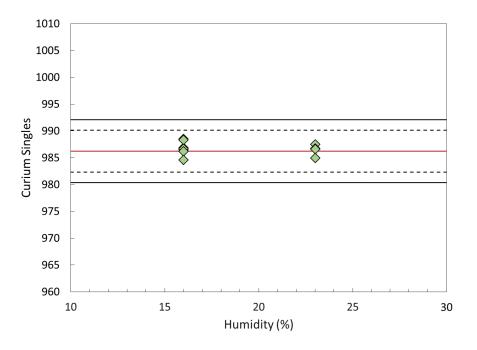

Figure 11: JFY19 Curium count rates as a function of humidity. Note that error bars are smaller than the size of symbols.

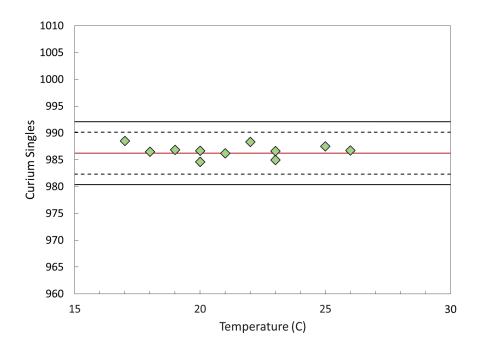

Figure 12: JFY19 Curium count rates as a function of room temperature. Note that error bars are smaller than the size of symbols.

5. HPGe System Performance

Based on updated contract, the frequency of HPGe system measurements was reduced to twice a year. Note that two additional measurements were performed during JFY19 to establish IPCA2 performance after rotation (see Section 8). The April 2019 through March 2020 measurements are summarized in Figures 14-19. No modifications to HPGe system hardware components were performed during JFY19 and the current configuration is shown in Figure 13 for reference.

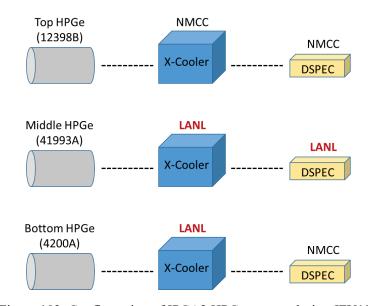

Figure 103: Configuration of IPCA2 HPGe system during JFY19.

5.1. Top HPGe Detector Performance Summary

The top detector (12698B) shows a good performance over the entire measurement period for the ²⁴⁰Pu/²³⁹Pu and ²⁴¹Pu/²³⁹Pu ratios for the entire JFY19 reporting period (Figure 14 and 15, left). An overview of the top HPGe detector performance from May 2013 is shown in Figure 14, 15 (right).

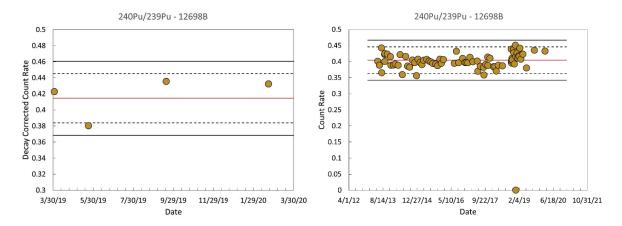

Figure 14: ^{240/239}Pu isotopic ratios as determined by the top IPCA2 HPGe for JFY19 (left); for the entire measurement period (right).

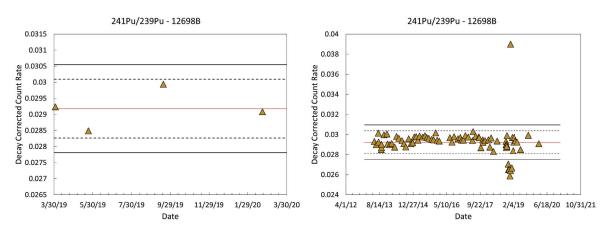

Figure 15: ^{241/239}Pu isotopic ratios as determined by the top IPCA2 HPGe for JFY19 (left); for the entire measurement period (right).

5.2. Middle HPGe Detector Performance Summary

The middle HPGe detector (41933A) shows a good performance over the entire measurement period for the ²⁴⁰Pu/²³⁹Pu and ²⁴¹Pu/²³⁹Pu ratios for the entire JFY19 reporting period (Figure 16 and 17, left). Note that the last two measurement on the middle HPGe detector had gain of 0.137 keV/ch as opposed to nominal 0.125 keV/ch. An overview of the middle HPGe detector performance from May 2013 is shown in Figure 16, 17 (right).

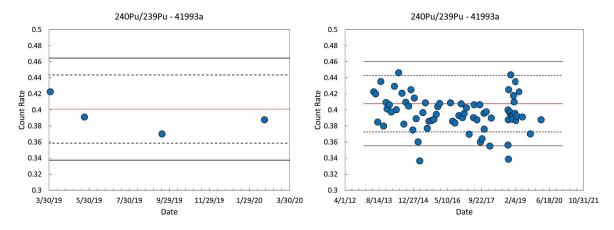

Figure 16: ^{240/239}Pu isotopic ratios as determined by the middle IPCA2 HPGe for JFY19 (left); for the entire measurement period (right).

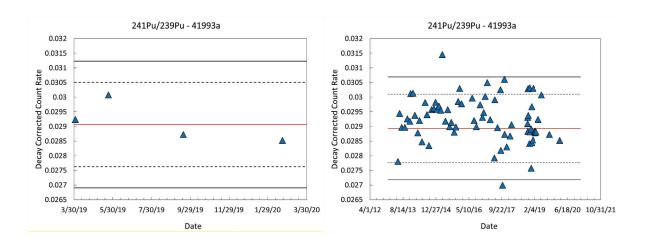

Figure 17: ^{241/239}Pu isotopic ratios as determined by the middle IPCA2 HPGe for JFY19 (left); for the entire measurement period (right).

5.3. Bottom HPGe Detector Performance

The bottom HPGe detector (4200A) shows a good performance over the entire measurement period for the ²⁴⁰Pu/²³⁹Pu and ²⁴¹Pu/²³⁹Pu ratios for the entire JFY19 reporting period (Figure 18 and 19, left). An overview of the bottom HPGe detector performance from May 2013 is shown in Figure 18, 19 (right). Note that original control bounds are used for bottom HPGe detector in all figures. Updated control bounds for JFY19 were not extracted from JFY18 data due to limited number of measurements available in JFY18 [2].

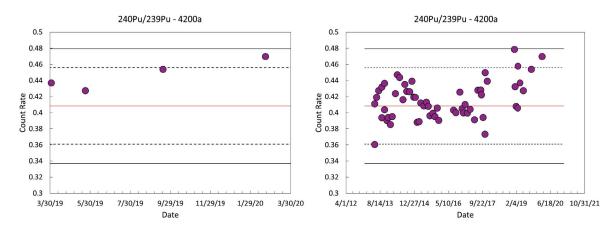

Figure 18: ^{240/239}Pu isotopic ratios as determined by the bottom IPCA2 HPGe for JFY19 (left); for the entire measurement period (right).

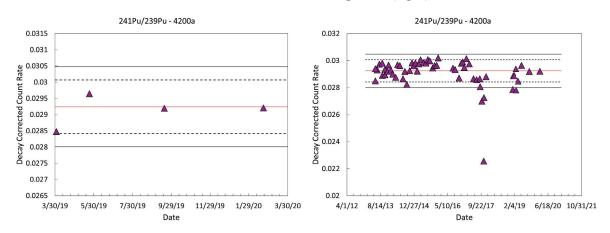

Figure 19: ^{241/239}Pu isotopic ratios as determined by the bottom IPCA2 HPGe for JFY19 (left); for the entire measurement period (right).

6. Load Cell Data

Regular load cell measurements were performed during April 2019 - March 2020 period. Each of these measurements resulted in a consistent weight of 22.69 kg.

7. Continuous Background Monitoring

As part of the contractual agreement, continuous neutron system background was acquired for IPCA2 during April 2019 through March 2020. The measurements were performed using MIC software and analyzed with RadReview. During September 2019 IPCA2 MIC2 was upgraded to MIC3 to fully support JSR15 and DSPEC50 capability and current report therefore represents the first MIC3 test in unattended mode for JSR15.

Singles count rates over the reporting period are shown in Figure 20 for April 2019 - July 2019 (top), July - November (middle) and September 2019 - March 2020 (bottom). The middle plot in Figure 20 shows the transition from MIC2 to MIC3. It can be seen that the data decoding for JSR15 by MIC2 was corrected in MIC3. Note that MIC2 recorded Singles were factor of 10 off for JSR15, which was mitigated in MIC3. MIC3 is not compatible with Windows XP installed on the IPCA2 computer and had to be installed on a separate LANL-owned Windows 10 laptop computer. Due to the default 'sleep' system power settings on the laptop, the MIC3 collection was occasionally interrupted during January - March timeframe. The triangular spikes in the bottom plot in Figure 20 correspond to these periods. The sleep settings have since been updated and such gaps should no longer be present during JFY20 measurements. The extended period of high counts in the middle plot corresponds to long-term AmLi measurement. Overall the Singles background exhibits regular variation between approximately 25 – 32 counts per second, which can be attributed to variation in cosmic ray background. The irregular high count rate spikes and intervals seen in Singles background correspond to various measurements that are occasionally performed in the High Bay area, where IPCA2 is located. Note that the area is used as a test ground for other LANL developed instrumentation and experiments are routinely performed throughout the year.

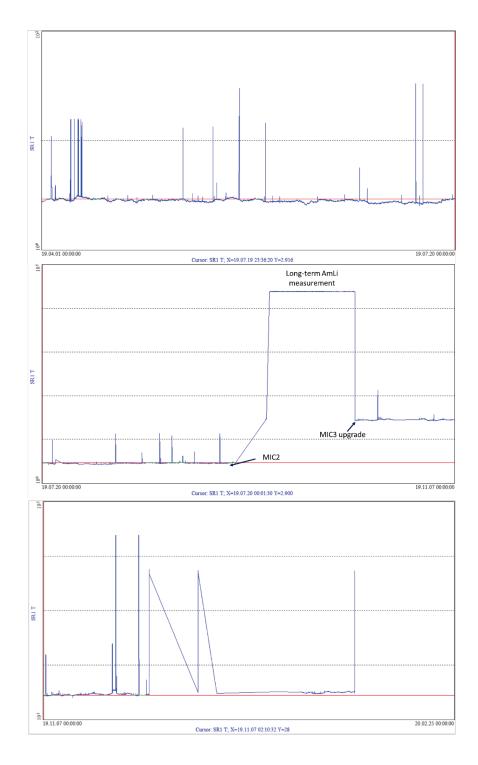

Figure 20: MIC recorded IPCA2 neutron background Singles over November 2018 through March 2019 period.

8. IPCA2 Rotation

This section provides a summary of IPCA2 performance during two rotations performed in JFY19. The first rotation was a demonstration during the JSGO/NMCC/JAEA visit in July 2019. The second represented a test of effects of long-term horizontal configuration on IPCA2 performance. The latter test was requested by JSGO/NMCC during the July 2019 visit in order to help assess effects of shipping IPCA2 in horizontal configuration on its performance. Unfortunately, both of the IPCA2 rotations occurred during the timeframe when use of Plutonium materials was restricted. The neutron system performance was therefore evaluated using a surrogate ²⁵²Cf source.

8.1. Rotation Demonstration

Rotation demonstration was performed in July 2019 and was preceded by series of ²⁵²Cf measurements to establish IPCA2 reference performance and control bounds for comparison after the rotation. Figure 21 summarizes the decay corrected ²⁵²Cf surrogate measurements before and after the rotation demonstration. As can be seen, the IPCA2 performance was unchanged as was also subsequently confirmed in the next Plutonium efficiency measurement performed in September 2019 (see Figure 1).

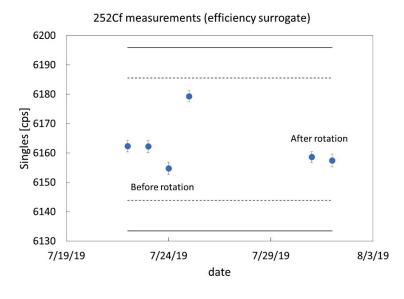

Figure 21: IPCA2 neutron system performance before and after July 2019 rotation demonstration.

8.2. Long-term Horizontal Configuration Test

During December 2019 a long-term horizontal test was performed, when IPCA2 was rotated and remained in horizontal configuration for approximately 1 month, between December 18 and January 29. During this test, the HPGe system as well as load cell were removed. The neutron

detectors remained operational, with the exception of December 23 – January 8, when the full system was powered down for winter break. After the rotation on January 29, the ²⁵²Cf surrogate measurements were performed to establish neutron system performance. Figure 22 shows the summary of all ²⁵²Cf surrogate measurements performed since July and include the measurement on December 5 immediately before the horizontal test and several measurements in January and February after the horizontal test was completed. The results of this test confirm that IPCA2 performance was not affected by long-term horizontal configuration, which is further supported by the Plutonium efficiency measurements performed in February (Figure 1) as well as by the monthly AmLi and Cm stability measurements (Figures 5 and 9). Note that one of ²⁵²Cf surrogate measurements in Figure 22 resulted in count rate just on the borderline of 3σ, which was likely due to ²⁵²Cf source positioning and was not observed in the subsequent measurements.

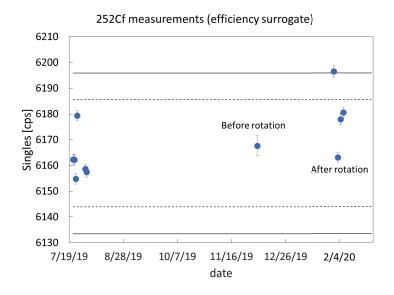

Figure 22: IPCA2 neutron system performance before and after long-term horizontal test.

9. Summary

Table 1 provides and overview of all the control measurements performed over the reporting period (April 2019 – March 2020). During the period of July-August, November-January and March 2020, the use of Plutonium containing materials was restricted, which prevented monthly Plutonium efficiency measurements during this period. As reported in this document, ²⁵²Cf surrogate measurements were performed instead, along with regular AmLi and Cm stability measurements to provide assurance on continuing stable IPCA2 performance.

Table 1: The number of measurements taken monthly organized by type.

Month	Pu Eff	AmLi	Cm	12698B (Top)	41993A (Middle)	4200A (Bottom)	Load Cell
April 2019	1	1	1	1	1	1	1
May 2019	1	1	1	1	1	1	1
June 2019	1	1	1	0	0	0	1
July 2019	0	1	1	0	0	0	1
August 2019	0	1	1	0	0	0	1
September 2019	1	1	1	1	1	1	1
October 2019	1	1	1	0	0	0	1
November 2019	0	1	1	0	0	0	1
December 2019	0	1	1	0	0	0	1
January 2020	0	1	1	0	0	0	1
February 2020	1	1	1	1	1	1	1
March 2020	0	TBI	TBI	0	0	0	TBI
Total	6	11	11	4	4	4	11

^{*}TBI = to be included. Note that these measurements were performed, but are yet to be included in the final report.

Results of the control measurements confirmed stability of Plutonium efficiency, which stayed within 2σ of the overall average value of 7.29 % established from JFY18 data in reference [2]. No dependence on environmental conditions (temperature, humidity) was observed. The average efficiency of these measurements (performed between April 2019 and March 2020) corresponds to 7.30 ± 0.05 . Updated control bounds were established based on this dataset (see Appendix A).

The AmLi stability measurements over the reporting period showed good performance, typically within 3σ of the overall average value established in reference [2]. No dependence on environmental conditions (temperature, humidity) was observed. The average count rate (decay corrected count with respect to 01/12/2017) for measurements performed between April 2019 and March 2020 corresponds to 24504 ± 55 . Updated control bounds were established based on the JFY19 data and are reported in Appendix A.

Curium source measurements were performed to evaluate its feasibility as a potential replacement for the AmLi source to mitigate issues observed in AmLi measurements [1] due to redistribution of source material and positioning. The average count rate (decay corrected with respect to the first measurement on 10/15/2018) for measurements performed between April 2019 and March 2020 corresponds to 986.7 ± 1.2 . No dependence on environmental conditions (temperature, humidity) was observed. Results were used to establish new control bounds as documented in Appendix A. Based on the trends observed so far, Curium appears to be a viable alternative to AmLi sources. Both sources will continue to be used during JFY20 control measurements.

HPGe system monitoring revealed consistent performance of all three detectors within the 3σ of expected performance. The middle detector exhibited a slight gain change during the last two measurements with 0.137 keV/ch as opposed to nominal 0.125 keV/ch. Due to the reduced number

of measurements the control bounds for all the HPGe detectors will remain unchanged and, if needed in the future, will be updated based on a larger set of aggregate data.

Two IPCA2 rotations were performed during the JFY19 reporting period with one focusing on long-term horizontal configuration impact on IPCA2 performance. Neutron and gamma measurements before and after the rotations confirmed unchanged IPCA2 performance. The long-term horizontal test and the fact that it confirmed no impact on IPCA2 performance represents an important assurance of IPCA2 functionality and robustness for future shipping considerations.

Software upgrade was performed during the JFY19 reporting period by upgrading MIC2 to MIC3 to support JSR15 read-out as well as DSPEC50 (note that IPCA2 currently uses DSPEC Plus). Initial test of MIC3 with JSR15 was performed between September 2019 and March 2020. However, the measurements were impacted by default power saving settings of the Windows 10 laptop used for MIC3 (note that MIC3 is not supported on Windows XP system). These settings resulted in gaps due to default computer sleep mode and will be removed for JFY20 measurements.

In summary, the neutron as well as gamma system performance exhibits expected trends and measurements will continue on monthly basis in JFY20 as permitted by the contract amendment approval process.

11. Appendix A

This Appendix provides an overview of updated control bounds calculated from JFY19 data that will be used during JFY20 control measurements.

11.1. Updated AmLi control bounds from JFY19 data

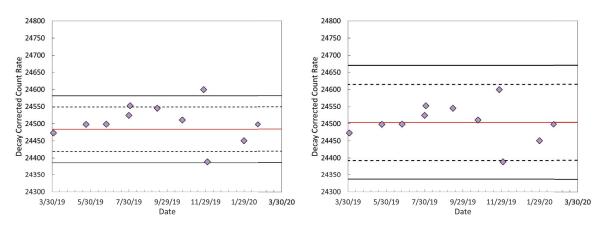

Figure 23: AmLi stability control bounds; current (JFY18) [2] (left); updated based on JFY19 data (right).

11.2. Updated Cm control bounds from JFY19 data

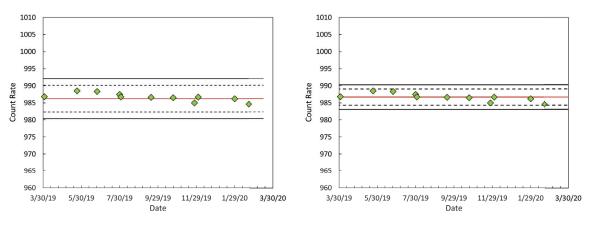

Figure 24: Cm stability control bounds; current (JFY18) [2] (left); updated based on JFY19 data (right).

Note that the wider control bounds extracted from JFY18 data in [2] were partially caused by an incomplete decay correction, which did not include contributions from ²⁴⁶Cm and ²⁴⁰Pu present in the source material. Current report uses updated decay correction, which resulted in improved trend of Cm data.

11.3. Updated efficiency control bounds from JFY19 data

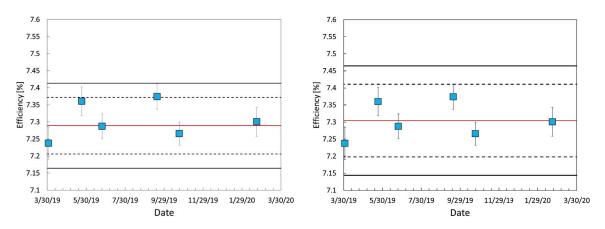

Figure 25: FZC 158 efficiency control bounds; current (JFY 18) [2] (left); updated based on JFY 19 data (right).

11.4. HPGe detector control bounds

Updated contract reduces frequency of HPGe control measurements to twice a year. Therefore, HPGe control bounds will be kept unchanged and control bounds extracted in [2] will be used in JFY20 measurements, due to the limited number of data points each year. Control bounds may be updated in the future based on a larger set of aggregate data, if needed.
